

ABSTRACT OF THE DISCLOSURE

A vertical window blind includes first and second slat units, each of which includes vertical slats. The first and second slat units are suspended respectively on first and second end portions of a headrail, and have tilting angles that are independently and respectively controlled by first and second angle-adjusting mechanisms. Each of the first and second angle-adjusting mechanisms includes a shaft journalled within the headrail, an operating rod connected operatively to the shaft and operable so as to actuate axial rotation of the shaft, and slat holders, each of which includes a slat hook coupled to the shaft such that axial rotation of the shaft results in corresponding rotation of the slat hook. Each of the vertical slats has an uppermost end connected to a respective one of the slat hooks.
